

# Industrialization

## • Positive

- important innovations of things (railway, light) which are still used today
- innovations which make an easier life -> railway; more comfortable, cheap,...
- many new factories
- many products

## • Negative

- climate
- many factory owners did not care about the health of their workers
- children were used as workers and they had very bad living conditions because they had to work all day long with no breaks
  - > got ill, died
- workers/children in factories got just little money for working very hard
- textile factories had toxics in their factories which made the workers sick

It's hard to say if Industrialization was good or bad but what we can say about it is that Industrialization brought many new inventions which make an easier life for all of us. Many things are even that important that they became an integral part of our infrastructure.

## inventions:

- machines in factories
- railway
- telegraph communications

## Child labour

Since industrialization began, child labour became more and more a big problem. Children had to work very hard and all day long. They just got a little money for all this. Additionally, the living conditions were very bad and the children often got ill or died.
